WHAT STARTS HERE CHANGES THE WORLD

Probability vs. Statistics

- Probability predicts the behavior of a sample given knowledge of the population
- Statistics infers properties of the population given knowledge of a sample
- The two are tied together by the **sampling distribution**

Sampling

- **Statistic:** any quantity computed from values in a sample
 - Sampling variability – variation of a statistic for different samples
 - **Sampling distribution** – the distribution of the statistic across all possible samples of the given size
- **Example: sample mean**
 - Sample = $\{X_1, X_2, \dots, X_n\}$
 - Sample mean = \bar{X} (a random variable)
 - Assume each X_i is *iid* ← independent and identically distributed

WHAT STARTS HERE CHANGES THE WORLD

Sampling Distribution of the Mean

- What is the expectation of the sample mean?

$$\bar{X} = \frac{1}{n} \sum_{i=1, n} X_i$$

population mean

$$E(\bar{X}) = \frac{1}{n} \sum_{i=1, n} E(X_i) = E(X_i) = \mu$$

- When the expectation value of the sample statistic is equal to the population statistic, we say that the sample statistic is an **unbiased estimator**

THE UNIVERSITY OF TEXAS AT AUSTIN
WHAT STARTS HERE CHANGES THE WORLD

Sampling Distribution of the Mean

- What is the variance of the sample mean?

$$\bar{X} = \frac{1}{n} \sum_{i=1, n} X_i$$

population variance

$$var(\bar{X}) = \frac{1}{n^2} var\left(\sum_{i=1, n} X_i\right) = \frac{\sigma^2}{n}$$

Assumes an infinite population

Standard deviation of the sample mean $\sigma_{\bar{X}} = \frac{\sigma}{\sqrt{n}}$

Law of Large Numbers

- Let X_1, X_2, \dots, X_n be iid random variables with mean μ and variance σ^2 .
- Then,

$$\mathbb{P}(|\bar{X} - \mu| > \epsilon) = 0 \text{ as } n \rightarrow \infty$$
- The average of the results obtained from a large number of trials will tend to become closer to the expected value as more trials are performed

THE UNIVERSITY OF TEXAS AT AUSTIN WHAT STARTS HERE CHANGES THE WORLD

Central Limit Theorem

- Let X_1, X_2, \dots, X_n be iid random variables with mean μ and finite variance σ^2 .
- Then,

$$Z = \frac{\bar{X} - \mu}{\sigma/\sqrt{n}}$$

is a RV with a distribution that approaches $N(0,1)$ as $n \rightarrow \infty$

- This is true regardless of the distribution for X_i

Student's t Distribution

- Alas, we rarely know the population variance
 - We estimate σ with s , the sample standard deviation
- If each X_i is $N(\mu, \sigma^2)$, let's define the Student's t -statistic:

$$t = \frac{\bar{X} - \mu}{s/\sqrt{n}}$$
- This t is a RV with the **Student's t** distribution and parameter $DF = n - 1$

© Chris Mack, 2014 8

THE UNIVERSITY OF TEXAS AT AUSTIN WHAT STARTS HERE CHANGES THE WORLD

Student's t Distribution

$t = \frac{\bar{X} - \mu}{S/\sqrt{n}}$

- As $DF = n - 1 \rightarrow \infty$, the Student's t becomes $N(0,1)$
- For $n > 30$ or so, $N(0,1)$ is a good approximation

THE UNIVERSITY OF TEXAS AT AUSTIN WHAT STARTS HERE CHANGES THE WORLD

Sampling Distribution of the Variance

- Let X_1, X_2, \dots, X_n be iid random variables with $X_i \sim N(\mu, \sigma^2)$
- For a sample variance S^2 ,

$$\chi^2 = \frac{(n - 1)S^2}{\sigma^2}$$
- is a RV with a **chi square distribution** and parameter $DF = n - 1$

© Chris Mack, 2014 10

THE UNIVERSITY OF TEXAS AT AUSTIN WHAT STARTS HERE CHANGES THE WORLD

Chi Square Distribution

$\chi^2 = \frac{(n - 1)S^2}{\sigma^2}$

Review #10: What have we learned?

- What is a sampling distribution, and why do we care about it?
- What is the Central Limit Theorem?
- What is the sampling distribution of the Mean?
- What is the Student's t distribution?
- What is the chi square distribution?
